Kit Contains:
~ 35% Hydrogen Peroxide
~ Photoactivator
~ Light Cure Dental Dam
~ Fluoride Gel
~ Protective Lip Balm
~ Everbrite Shade Guide
~ Mixing and Application Accessories

In Office Tooth Whitening Kit (for professional use only)

Properties
Everbrite™ In-office Tooth Whitening Kit is designed for application by the dentist. The active ingredient in our bleach is extremely small in size and easily enters your tooth's pores, following the same route as stain-stain-causing foods and drinks. **One hour treatment.**

1. Examine the oral cavity and make sure there are no cavities or gingival tissue abnormalities.
2. Proply and make sure the teeth are clean and clear of debris before applying the whitening gel.
3. Use the Everbrite shade guide to record the patient's shade data before the whitening procedure.
4. Apply protective lip balm around the lip area. Place the protective mouth bbl under the check cushion and position the retractor and mouth bbl to fit comfortably around the mouth area for protection.
5. Use cotton rolls to separate the teeth to be whitened from the labial and lingual sides.
6. Use cotton rolls to insulate and protect the tongue.
7. Use a 3-way air syringe to dry the gingival tissue of the teeth to be whitened.
8. Insert the syringe tip onto the Sofluma syringe and apply evenly to the gingival and subgingival area to isolate them from the whitening gel. The dental dam should cover the entire gingival area and 0.5 mm around the gingival level of the tooth.
9. Using the Litex 685 Plasma Arc Light, hold the light tip 1 cm away from the light cure dental dam. 3 seconds of curing time is sufficient. Light cure 20 seconds if using a standard dental curing light. Repeat until the entire surface has been cured.
10. The material is for one-time use only. After opening the jar, finish it immediately. Do not store the material after it has been opened.
11. Cut and squeeze the vial of hydrogen peroxide into the jar of photoactivator. Be sure to use gloves and eye protection when handling materials.
12. Use the spatula to stir the solution for about 30 seconds until thoroughly mixed, forming a gel-like material.
13. Fill the syringe with the mixed gel using the spatula.
14. Apply the gel to the teeth that are to be whitened through the syringe.
15. Make sure the gel is evenly distributed and about 2 mm thick. Use the brush to apply the gel evenly on the teeth. Maintain about 1 cm away from the gingiva.
16. Place the whitening arch about 5 to 10 mm away from the tooth to be whitened. **NOTE:** Patients and all dental personnel in the operatory must wear orange eye protection glasses.
17. Select the "ARCH WHITENING" button on the Litex 685 for the whitening program.
18. The Litex 685 has a built-in whitening program. This program runs 15 whitening cycles for a total of 10 minutes. Each cycle consists of a 5-minute light activation period and a 10-second resting period.
19. To begin the whitening program, trigger the magnetic ring on the handpiece. The light will activate and the program display will begin to count down.
20. After the first 10-minute program has been completed, make sure the whitening gel remains only on the area of treatment. Section and or brush gel off areas not intended for whitening.
21. Complete an additional three more cycles for a total of four 10-minute programs (40 minutes). For patients with heavy staining, an additional 10-minute cycle can be added for better results.
